## FLUOROPYRROLIDINES AS DIPEPTIDYL PEPTIDASE INHIBITORS

### Field of Invention

The present invention relates to compounds inhibiting dipeptidyl peptidases,  
5 such as II (DPP-II) and IV (DPP-IV), to methods for their production, and to their  
therapeutic utility.

### Background of the Invention

Dipeptidyl peptidase IV (DPP-IV) is a post-proline/alanine cleaving serine  
protease found in various tissues of the body including kidney, liver, and intestine.  
10 DPP-IV is thought to regulate the activity of multiple physiologically important  
peptides, including, but not limited to, GLP1, GIP, GLP2, GRP, vasoactive intestinal  
peptide, peptide histidine methionine, PYY, substance P, beta-casomorphine, NPY,  
PACAP38, prolactin, chorionic gonadotropin, aprotinin, corticotropin-like intermediate  
lobe peptide, pituitary adenylyl cyclase-activating peptide, (Tyr)melanostatin,  
15 LD78beta(3-70), RANTES, eotaxin, procolipase, enterostatin, vasostatin 1, endomorphin,  
morphiceptin, stromal cell derived factor, macrophage-derived chemokine,  
granulocyte chemotactic protein-2, and GHRH/GRF. As examples of the therapeutic  
value of DPP-IV, DPP-IV is believed to be involved in a variety of metabolic,  
gastrointestinal, viral, and inflammatory diseases, including, but not limited to,  
20 diabetes, obesity, hyperlipidemia, dermatological or mucous membrane disorders,  
psoriasis, intestinal distress, constipation, autoimmune disorders such as  
encephalomyelitis, complement mediated disorders such as glomerulonephritis,  
lipodystrophy, and tissue damage, psychosomatic, depressive, and neuropsychiatric  
disease such as anxiety, depression, insomnia, schizophrenia, epilepsy, spasm, and

chronic pain, HIV infection, allergies, inflammation, arthritis, transplant rejection, high blood pressure, congestive heart failure, tumors, and stress-induced abortions, for example cytokine-mediated murine abortions. For example, DPP-IV, also known as CD26, mediates T-cell activation and HIV infection (Ohtsuki et al., 2000). T-cells  
5 expressing DPP-IV/CD26 are preferentially infected and depleted in HIV-infected individuals (Ohtsuki et al., 2000). DPP-IV inhibitors have demonstrated anti-inflammatory effects in animal models of arthritis (Tanaka et al, 1997). Additionally, DPP-IV inhibition has been shown to prolong cardiac transplant survival (Korom et al., 1997). *In vitro* studies suggest that DPP-IV/CD26 expression correlate with tumor  
10 progression of malignant melanomas of the skin (Van den Oord, 1998). Furthermore, DPP-IV is thought to regulate metabolism by cleaving the penultimate proline/alanine at the amino-terminus of polypeptides (Mentlein, 1999), such as glucagon-like peptides (GLP) and neuropeptide Y (NPY).

More specifically, GLPs help metabolize glucose and, thus, regulation of GLPs  
15 likely should be beneficial in the treatment of metabolic disorders such as diabetes. Diabetes, for example type 2 (also called noninsulin-dependent diabetes mellitus (NIDDM) or maturity-onset) diabetes, results in elevated blood sugar levels due to absolute or relative insufficiencies of insulin. Type 2 diabetes is the more common form of diabetes, accounting for 90% of cases, or about 16 million Americans. Most  
20 type 2 diabetics produce variable, sometimes normal, amounts of insulin, but they have abnormalities in liver and muscle cells that resist its actions. Insulin attaches to the receptors of cells, but glucose does not get inside, a condition known as insulin resistance. Many type 2 diabetics seem to be incapable of secreting enough insulin to overcome insulin resistance. GLP-1 enhances insulin secretion. Thus, regulation of

GLP-1 correlates to a regulation of insulin secretion. Moreover, GLP-1 decreases hepatic glucose production, gastric emptying, and food intake (Deacon et al., 1995). Further, GLP-2 maintains the integrity of the intestinal mucosal epithelium via effects on gastric motility, nutrient absorption, crypt cell proliferation and apoptosis, and  
5 intestinal permeability (Drucker, 2001).

DPP-IV inhibitors preserve GLP-1 function for a longer time (Balka, 1999). Thus, DPP-IV inhibitors may promote satiety, weight loss, and the antidiabetic effects of GLP-1 (Deacon et al., 1995; Holst and Deacon, 1998). For example, inhibition of DPP-IV with the known compound NVP-DPP728 increases plasma GLP-1 (2-36 amide)  
10 concentrations and improves oral glucose tolerance in obese Zucker rats. See, Diabetologia 42: 1324-1331. Both subcutaneously and intravenously administered GLP-1 is rapidly degraded from the NH<sub>2</sub>-terminus in type II diabetic patients and in healthy subjects. See, Diabetes 44:1126, 1995.

Moreover, DPP-IV inhibitors preserve GLP-2 for longer periods of time and,  
15 thus, may be useful for treating intestinal insufficiencies and mucous membrane disorders (Hartmann B et al., 2000).

While DPP-IV is the predominate protease regulating GLP turnover, similar substrate or inhibitor specificity may be observed for related proteases. Related serine proteases include, but are not limited to, dipeptidyl peptidase-II (DPP-II), dipeptidyl  
20 peptidase IV beta, dipeptidyl peptidase 8, dipeptidyl peptidase 9, aminopeptidase P, fibroblast activating protein alpha (seprase), prolyl tripeptidyl peptidase, prolyl oligopeptidase (endoproteinase Pro-C), attractin (soluble dipeptidyl-aminopeptidase), acylaminoacyl-peptidase (N-acylpeptide hydrolase; fMet aminopeptidase) and lysosomal Pro-X carboxypeptidase (angiotensinase C, prolyl carboxypeptidase).

Proline-cleaving metallopeptidases that may share similar substrate or inhibitor specificity to DPP-IV include membrane Pro-X carboxypeptidase (carboxypeptidase P), angiotensin-converting enzyme (Peptidyl-dipeptidase A multi-peptidase], collagenase 1 (interstitial collagenase; matrix metalloproteinase 1; MMP-1; Mcol-A), ADAM 10 (alpha-secretase, myelin-associated disintegrin metalloproteinase), neprilysin (atriopeptidase; CALLA; CD10; endopeptidase 24.11; enkephalinase), Macrophage elastase (metalloelastase; matrix metalloproteinase 12; MMP-12], Matrilysin (matrix metalloproteinase 7; MMP-7), and neurolysin (endopeptidase 24.16; microsomal endopeptidase; mitochondrial oligopeptidase). See <http://merops.iapc.bbsrc.ac.uk/>.

Furthermore, beyond mammalian serine peptidases and proline-cleaving metallopeptidases, other non-mammalian proteases may share similar substrate or inhibitor specificity to DPP-IV. Non-limiting examples of such non-mammalian serine proteases include prolyl aminopeptidase (prolyl iminopeptidase), IgA1-specific serine type prolyl endopeptidase (IgA protease, *Neisseria*, *Haemophilus*), dipeptidyl aminopeptidase A (STE13) (*Saccharomyces cerevisiae*), dipeptidyl aminopeptidase B (fungus), prolyl oligopeptidase homologue (*Pyrococcus* sp.), oligopeptidase B (*Escherichia coli* alkaline proteinase II; protease II), dipeptidyl aminopeptidase B1 (*Pseudomonas* sp.), dipeptidyl-peptidase IV (bacteria), dipeptidyl aminopeptidase (*Aureobacterium*), dipeptidyl-peptidase IV (insect), dipeptidyl-peptidase V, allergen Tri t 4 (*Trichophyton tonsurans*), secreted alanyl DPP (*Aspergillus oryzae*), peptidase II-mes (*Prosopis velutina*), and bamboo serine proteinase (*Pleioblastus hindsii*). Non-limiting examples of such non-mammalian proline-cleaving metallopeptidases include penicillolysin (fungal acid metalloendopeptidase), proline-specific peptidyl-dipeptidase (*Streptomyces*), coccolysin (gelatinase, *Enterococcus faecalis*), aminopeptidase Ey,

(hen egg yolk) (apdE g.p.; *Gallus gallus domesticus*), gametolysin (*Chlamydomonas* cell wall degrading protease), and snake venom proline-cleaving metalloproteases as well. See <http://merops.iapc.bbsrc.ac.uk/> for further reference.

Dipeptidyl peptidase II (DPP II) is a serine protease localized to lysosomes in cells and believed to be involved in lysosomal degradation and protein turnover. The order of expression of DPP-II is kidney >> testis > or = heart > brain > or = lung > spleen > skeletal muscle > or = liver (Araki H et al., J Biochem (Tokyo) 2001, 129:279-88). This expression suggests possible utility in kidney or lysosomal-related disorders. Substrate specificity studies indicated that purified DPP-II hydrolyzes specifically alanine or proline residues at acidic pH (4.5-5.5). DPP-II has significant sequence homology and substrate specificity to quiescent cell proline dipeptidase and prolyl carboxypeptidase, suggesting possible overlapping functions between these proteases (Araki H et al., J Biochem (Tokyo) 2001, 129:279-88).

The present invention includes novel DPP-II and/or DPP-IV inhibitors, as well as methods of their therapeutic use and methods of their production. While not being limited thereby, the compounds of the present invention are believed useful for the treatment of a variety of metabolic, gastrointestinal, viral, and inflammatory diseases, including, but not limited to, diabetes, obesity, hyperlipidemia, dermatological or mucous membrane disorders, psoriasis, intestinal distress, constipation, autoimmune disorders such as encephalomyelitis, complement mediated disorders such as glomerulonephritis, lipodystrophy, and tissue damage, psychosomatic, depressive, and neuropsychiatric disease such as anxiety, depression, insomnia, schizophrenia, epilepsy, spasm, and chronic pain, HIV infection, allergies, inflammation, arthritis, transplant

rejection, high blood pressure, congestive heart failure, tumors, and stress-induced abortions, for example cytokine-mediated murine abortions.

As used herein, the term "effective amount" means that amount of a drug or pharmaceutical agent that will elicit the biological or medical response of a tissue, system, animal, or human that is being sought, for instance, by a researcher or clinician. Furthermore, the term "therapeutically effective amount" means any amount which, as compared to a corresponding subject who has not received such amount, results in improved treatment, healing, prevention, or amelioration of a

disease, disorder, or side effect, or a decrease in the rate of advancement of a disease or disorder. The term also includes within its scope amounts effective to enhance normal physiological function.

The therapeutically effective amount of a compound of the present invention  
5 will depend upon a number of factors including, for example, the age and weight of the animal, the precise condition requiring treatment and its severity, the nature of the formulation, and the route of administration. Therapeutic effectiveness ultimately will be at the discretion of the attendant physician or veterinarian. An effective amount of a salt or solvate, or pharmaceutically functional derivative thereof, may be  
10 determined as a proportion of the effective amount of a compound of the present invention *per se*. Dosages may vary, depending upon the appropriate inhibition of DPP-IV for purposes of treatment or prophylaxis of a variety of metabolic, gastrointestinal, viral, and inflammatory diseases, including, but not limited to, diabetes, obesity, hyperlipidemia, dermatological or mucous membrane disorders,  
15 psoriasis, intestinal distress, constipation, autoimmune disorders such as encephalomyelitis, complement mediated disorders such as glomerulonephritis, lipodystrophy, and tissue damage, HIV infection, allergies, inflammation, arthritis, transplant rejection, high blood pressure, congestive heart failure, tumors, and stress-induced abortions, for example cytokine-mediated murine abortions.

20 No toxicological effects are indicated/expected when a compound of the present invention is administered in the above mentioned dosage range.

The present invention should be interpreted to cover all combinations of particular and preferred groups herein described. The application of which this description and claims forms part may be used as a basis for priority in respect of any

subsequent application. The claims of such subsequent application may be directed to any feature or combination of features described herein. They may take the form of product, composition, process, or use claims and may include, by way of example and without limitation, the claims hereto appended.

20   ionization (ESI), chemical ionization (CI), electron impact (EI) or by fast atom bombardment (FAB) methods. Infrared (IR) spectra were obtained on a Nicolet 510 FT-IR spectrometer using a 1-mm NaCl cell. All reactions were monitored by thin-layer chromatography on 0.25 mm E. Merck silica gel plates (60F-254), visualized with UV light, 5% ethanolic phosphomolybdic acid or p-anisaldehyde solution. Flash

### EXPERIMENTALS

Compounds of the present invention may be prepared according to the preferred scheme detailed below:

10

More specifically, a compound of formula (II) can be reacted with an acid halide (for example, bromoacetyl bromide) in an organic solvent (for example methylene chloride) in the presence of an organic base (for example N,N-diisopropylethyl amine) to generate compounds of formula (VIII). Compounds of formula (VIII) can then be reacted with a basic amine in an organic solvent (for

15

example acetonitrile) in the presence of an organic base (for example N,N-diisopropylethyl amine) to generate compounds of formula I.

As an alternative, compounds of the present invention can be generated as outlined below:

5

More specifically, a compound of formula (II) can be reacted with a suitably protected amino acid (wherein P designates an appropriate protecting group) in the presence of a coupling agent (for example HATU) with a suitable organic base (for example Hunigs base) in a suitable organic solvent (for example N,N-dimethylformamide) to generate compounds of formula (IX). A compound of formula (IX) can then be deprotected to generate compounds of formula I.

Typical amine protecting groups and their removal can be found in: "Protective Groups in Organic Synthesis" Greene, T. W.; Wuts, P. G. M. Wiley & Sons Third Ed. 1999, herein incorporated by reference as related to amine protecting groups and removal.

Intermediate Example 1(2S, 4S)-4-Fluoro-2-pyrrolidinecarbonitrile 4-methylbenzenesulfonate.

A. Methyl (2S, 4R)-4-hydroxy-2-pyrrolidinecarboxylate hydrochloride.

- 5 To a MeOH solution (420 mL) containing L-hydroxyproline (62.67 g, 478 mmol) cooled in an ice water bath was added thionyl chloride (58.6 g, 492.3 mmol) dropwise. Upon complete addition the suspension was stirred at RT for 2 h. The mixture was then heated to reflux for 6 h at which time it was cooled to RT and the solvent removed *in vacuo*. The residual solid was pumped on under high vacuum yielding
- 10 86.03 g (474 mmol, 99% yield) of compound A as a white solid.

$^1\text{H}$  NMR ( $d_4$ -MeOH) 400 MHz  $\delta$  4.62–4.57 (m, 2H), 3.85 (s, 3H), 3.43 (dd, 1H,  $J$  = 12.2, 3.7 Hz), 3.30 (m, 1H), 2.41 (dd, 1H,  $J$  = 13.6, 7.6 Hz), 2.19 (m, 1H) ppm.

B. 1-Tert-butyl-2-methyl (2S, 4R)-4-hydroxy-1,2-pyrrolidinedicarboxylate.

- 15 To a  $\text{CH}_2\text{Cl}_2$  solution (1.4 L) containing compound A (88.67 g, 0.49 mol) and di-*t*-butyldicarbonate (109.8 g, 0.50 mol) was added, at 0 °C, triethylamine (123.6 g, 1.22 mol) dropwise over 1.5 h. The resulting solution was then slowly allowed to warm to RT overnight. The solvent was then removed *in vacuo* and  $\text{Et}_2\text{O}$  was added to the residual solid. The solid was collected via vacuum filtration and washed thoroughly
- 20 with  $\text{Et}_2\text{O}$ . The filtrate then had the solvent removed *in vacuo* and was dissolved in  $\text{CH}_2\text{Cl}_2$ . The organics were washed with sat. NaCl and sat.  $\text{NaHCO}_3$  followed by drying over  $\text{MgSO}_4$ . Filtration and removal of the solvent *in vacuo* yielded a light yellow oil

which, after pumping on under high vacuum for ~ 15 min., solidified. The resulting solid had 500 mL of hexanes added to it and then stirred overnight. The solid was collected via vacuum filtration and pumped on under high vacuum yielding 104.5g (0.43 mol, 87% yield) compound B as a white solid.

5       <sup>1</sup>H NMR (d<sub>4</sub>-MeOH) 400 MHz δ 4.37–4.32 (m, 2H), 3.72–3.71 (m, 3H), 3.51 (m, 1H), 3.43 (m, 1H), 2.23 (m, 1H), 2.02 (m, 1H), 1.42 (m, 9H) ppm.

C. 1-Tert-butyl 2-methyl (2S, 4S)-4-fluoro-1,2-pyrrolidinedicarboxylate.

To a 2 L flask containing compound B (124.25 g, 0.51 mol), in 1.25 L of 1,2-  
10 dichloroethane cooled to -30 °C, was added DAST neat (125 g, 0.78 mol). The reaction slowly warmed to -10 °C over 1 hr at which time the cold bath was removed. Stirring continued at RT for 24 hr when the dark solution was poured into two 2 L flasks that contained crushed ice and solid NaHCO<sub>3</sub>. The flasks were periodically swirled and stirred until no CO<sub>2</sub> evolution was observed (note: additional solid NaHCO<sub>3</sub> was  
15 periodically added). The organic layer was separated and the aqueous layer extracted with CH<sub>2</sub>Cl<sub>2</sub>. After drying over MgSO<sub>4</sub> the solvent was removed *in vacuo* and the residual dark oil was dissolved in 200 mL of EtOAc and then 800 mL of hexanes was added. To this solution was added 100 g of SiO<sub>2</sub>. After stirring for 30 min the solution was filtered with the SiO<sub>2</sub> being washed with hexanes/EtOAc (4:1, ~ 500 mL). Removal  
20 of the solvent *in vacuo* and pumping on under high vacuum overnight yielded 121.81 g (0.40 mol, 97% yield) of compound C as a dark oil.

<sup>1</sup>H NMR (CDCl<sub>3</sub>) 400 MHz δ 5.18 (d(br), 1H, *J* = 53 Hz), 4.53 (d, 1/2H, *J* = 9.7 Hz), 4.40 (d, 1/2H, *J* = 9.4 Hz), 3.87–3.59 (m, 2H), 3.73 (s, 3H), 2.51–2.28 (m, 2H), 1.46 (s, 3H, rotomer), 1.41 (s, 6H, rotomer) ppm.

D. (2S, 4S)-1-(Tert-butoxycarbonyl)-4-fluoro-2-pyrrolidinecarboxylic acid.

To a 2 L flask containing compound C (121.8 g, 0.49 mol), in 1.1 L of dioxane, was added 380 mL of H<sub>2</sub>O followed by lithium hydroxide hydrate (103.6 g, 2.46 mol) at RT.

5 The resulting solution stirred for 23 hr (note: by TLC the reaction appeared to be done after 5 hr.) at which time the bulk of the dioxane was removed *in vacuo*. The residual material was dissolved in additional H<sub>2</sub>O and then charcoal was added. After stirring for 15 min., the solution was filtered through a bed of celite. The filtrate had solid NaCl added to it until it didn't dissolve any further. It was then cooled in an ice water bath and was acidified with concentrated HCl to pH 3 whilst maintaining the solution temperature between 5 - 10 °C. The product began to precipitate out at pH 4 and upon reaching pH 3 the tan solid was collected via vacuum filtration. After pumping on under high vacuum overnight the solid was dissolved in CH<sub>3</sub>CN (1.5 L) and dried over MgSO<sub>4</sub>. Removal of the solvent *in vacuo* and drying under high vacuum yielded 15 92.7 g (0.40 mol, 81% yield) of compound as a tan solid.

### COMPARATIVE EXAMPLES

Compounds of the present invention were tested against non-fluorinated counterpart compounds to determine relative potency, duration, and selectivity. The results of such comparative testing illustrate several surprising and unexpected benefits. More specifically, the comparative tests indicate that the fluorinated compounds of the present invention demonstrate: (i) increased potency, as characterized by DPP-IV inhibition activity measured from plasma; (ii) increased selectivity; and/or (iii) increased duration.

When compounds of the present invention were tested *in vivo* at time periods ranging from 0 to 10 hours, the compounds of the present invention demonstrated a significant increase in DPP-IV inhibition over the non-fluorinated counterparts. Thus, the compounds of the present invention provide an unexpected potency that was not heretofore appreciated.

### BIOLOGICAL DATA

#### Materials:

H-Ala-Pro-pNA•HCl was purchased from BACHEM Bioscience Inc. (product no. L-1115). A 500 mM stock solution was prepared with dimethylsulfoxide and stored at

-20 °C. Gly-Pro-AMC was purchased from Enzyme System Products (product no. AMC-39) and stored at -20 °C as a 10 mM stock solution in dimethylsulfoxide. Test compounds were dissolved to 10 mM in dimethylsulfoxide and this was used as a stock solution for DPP-IV titration assays. Athens Research and Technology, Inc prepared the purified human DPP-IV. The material was isolated from human prostasomes using the method of DeMeester et al., *J. Immunol. Methods* 189, 99-105. (1996).

#### DPP-IV Assay:

Two-fold serial dilutions of test compounds in 100 % dimethylsulfoxide were performed in 96-well polystyrene flat bottom plates (Costar, #9017). The average enzymatic activity from wells containing dimethylsulfoxide but lacking test compound was used as a control value for calculating percent inhibition. DPP-IV (20 ng/mL) was mixed in microtiter plates with test compounds, substrate and assay buffer to yield 100 µM H-Ala-Pro-pNA•HCl in 25 mM Tris, pH 7.5, 10 mM KCl, 140 mM NaCl. The intact peptide contains a p-nitrophenylanilide which, when hydrolyzed by DPP-IV, releases the absorbant p-nitrophenylaniline. The absorbency was monitored in 20 minutes intervals at a wavelength of 387 nm using a Molecular Devices SpectraMax 250 absorbency plate reader. The enzymatic activity was determined by estimating the best linear fit to the data. Values for enzymatic activity were taken directly from the linear fit determined by the software on the plate reader.

Data Analysis: The enzymatic activity was determined by estimating the best linear fit to the data. Data reduction was performed using the Microsoft Excel RoboSage.

*Determination of IC<sub>50</sub> values:* The enzymatic activity was plotted against the concentration of test compound, including  $[I] = 0$ , and the IC<sub>50</sub> determined from a fit of equation 2 to the data.

$$\text{RATE} = V_{\max} / (1 + ([I] / IC_{50})) \quad (2)$$

- 5  $V_{\max}$  was the best fit estimate of the maximal enzymatic activity.

*Determination of K<sub>i</sub> values:* K<sub>i</sub> values were calculated from IC<sub>50</sub> values using equation 3 assuming a competitive model.

$$K_i = IC_{50} * [1 - \frac{S}{(S + K_m)}] \quad (3)$$

The apparent pK<sub>i</sub> values were > 5.0 for each of the examples.

10 DPP-II Assay:

- The intermediate plate contained 5.3 µL of test compound in 2-fold serial dilutions across the plate. A volume of 209 µL of buffer (100 mM sodium acetate pH 5.5) containing substrate (H-Lys-Ala-pNA·2HCl; product no. L-2085; BACHEM Bioscience Inc.) was added to each well of the intermediate plate, then mixed. The
- 15 reaction was initiated with the transfer of 180 µL of the substrate/test compound solution to the assay plate containing 20 µL of enzyme. Final concentrations in the assay were 100 nM enzyme and 1000 µM substrate in 100 mM NaOAc, pH 5.5, 2.5% DMSO in a final volume of 200 µL. The absorbance was monitored every 20 minutes for 5 hours at 387 nm using a Molecular Devices SpectraMax 250 absorbance plate
- 20 reader.

Data Analysis: The enzymatic activity was determined by estimating the best linear fit to the data. Data reduction was performed using the Microsoft Excel RoboSage.

*Determination of IC<sub>50</sub> values:* The enzymatic activity was plotted against the concentration of test compound, including [I] = 0, and the IC<sub>50</sub> determined from a fit of equation 2 to the data.

$$\text{RATE} = V_{\max} / (1 + ([I] / IC_{50})) \quad (2)$$

V<sub>max</sub> was the best fit estimate of the maximal enzymatic activity.

*Determination of K<sub>i</sub> values:* K<sub>i</sub> values were calculated from IC<sub>50</sub> values using equation 3 assuming a competitive model.

$$K_i = IC_{50} * [1 - \frac{S}{(S + K_m)}] \quad (3)$$

Certain compounds of the present invention showed activity for DPP-II, for example pK<sub>i</sub> values > 6.0, while others demonstrated selectivity for DPP-IV, discussed hereinabove.

#### 15 In vivo studies:

Age and weight matched male CD1 mice were housed individually at 72° F and 50% relative humidity with a 12 h light/dark cycle. Animals were dosed by oral gavage with 10 ml/kg vehicle (0.5% methylcellulose (HPMC) with 0.1% Tween 80) or 1 mg/kg test compound in vehicle. The animals were anesthetized with isoflurane for blood collection at the specified times (0-6 hours). Plasma DPP-IV activity was measured using the fluorogenic substrate Gly-Pro-AMC (50 μM) according to the

manufacturers specification (Enzyme System Products, Livermore CA). The substrate was mixed with 50 mM Tris, pH 7.8 and 20% plasma. The samples were incubated for 20 min at 30°C and fluorescence measured using a cytofluor spectrofluoremeter with the filters set at 360 nm excitation and 460 nm emission.
